About the remote ID

About the remote ID

Involved in a registration obligation of an UA, a remote ID feature must be included to transmit ID information remotely and wirelessly, in addition to the physical indication of the registration ID to the UA.

The remote ID feature which allows you to transmit the ID information remotely and wirelessly can be categorized as built-in or external.

If the remote ID is not built in the UA or an amateur-built UA is used, it is necessary to purchase an remote ID equipment (external) and install it on the UA.

If a new external remote ID equipment is installed or the existing equipment is replaced, the UA manufacturer name of the remote ID equipment, type of the remote ID equipment, and the UA serial number of the remote ID equipment must be registered and changed.

When you send the registration ID from the registration ID equipment, use a dedicated smartphone app "DIPS APP." For using the app and the details of the remote ID, consult the MLIT homepage or the operating manual of "DIPS APP".
